

So, to summarise...

at relatively **low cost** we would build large areas of **ocean orchards**...

this would make **millions of tonnes** of new fish, worth **billions**, and increase food security...

ocean orchards rejuvenate ravaged areas of seabed, restore biodiversity, and allow large **MPAs** to be established elsewhere...

Traceability would be easy to manage, and fishing **jobs** would be secured...

It even grows **large areas of reef!**

Sounds good to me!
